

Dear Patient.

You have now received an implant, which is a very good solution for a lost tooth.

For the long-time success of implants, maintenance is key!

Implants need regular care. This is to avoid disease of the implant, so called peri-implant disease.

What is peri-implant disease?

Bacteria cause inflammation in the soft tissues around the implants. This may lead to loss of bone and, in worst case, your implant.

How to avoid peri-implant disease?

- Thorough daily oral hygiene according to your dental therapist's instructions
- Regular follow up by your dentist/dental therapist, 2-4 times a year
- Reduction of or preferably avoiding smoking

Labrida BioClean® is a safe and efficient device used by your dental therapist for maintaining your implant.

Labrida BioClean®

- Reduces inflammation
- Offers a gentle and painless treatment
- Minimizes the need for anesthesia
- Prolonges the lifetime of your implant

Number of maintenance treatments recommended per year:

2 _____

3 _____

4 _____

Recommended daily oral hygiene at home:

Floss _____

Implant brushes _____

Interdental brushes _____
